

Scalewatcher®

Now tested and endorsed by Roger Bisby

Roger Bisby is products editor of Professional Builder magazine and is also a registered plumber. He has a weekly trouble shooting spot on London Radio and appears regularly on national television as a spokesman for the plumbing and heating industry.

“

I have been running a Scalewatcher in my house since January 1993. My test for Home Building and Decorating magazine was completely objective.

I can confirm that it worked in accordance with the manufacturer's claims and continues to work very well. In reducing the build up of scale in your hot water system it can save you a considerable amount of money. Tests show that as little as 3 millimetres of scale can increase fuel costs by 15%. Most houses in hard water areas have a lot more than this, so a Scalewatcher could pay for itself in a couple of years - after

which it is putting money into your bank. That's the product but what about the company selling it?

With so many inexperienced companies now entering this market you need to be sure that the guarantee is genuine. Scalewatcher is the original electronic water conditioner launched in 1989 and I can confirm that Fast Systems is achieving a genuine 98% success rate with the product. They aren't in business to give money back but if they can't solve your scale problem you will be given a full refund, without fuss or quibbling.

Scalewatcher®

The simple solution that really works

“

We had your electronic descaler fitted in May 2002 as we had just had a new bathroom fitted and wanted to keep taps etc unspoilt with water scaling (which is very bad in the area we live with the hard water) and we already had bad scaling on our other sanitary fittings.

We got the tank back to Fast Systems HQ and cut it open - this is what we found.

Since then the new taps are still like new and the old taps and toilet became clear of old scale a few months after the electronic descaler was fitted. I was very happy with your electronic descaler but the main test was today when we had our indirect hot water cylinder removed because it was leaking and I was interested to see what condition the tank was in inside as it was originally fitted 20/1/88. With a torch I could see how clear the tank and coil were despite being 18 years old. I could see no scale at all except for some small loose

lumps of scale in the bottom of the drained tank. What a contrast to the previous hot water cylinder we had removed in 1988 which was completely furred up with scale. I was elated to see how well your descaler had worked because we are about to have a new combination boiler fitted and I am totally confident that your descaler will keep it running efficiently.

The local plumber was also very impressed with the clean condition of the cylinder after such a long period of time. The water cylinder was leaking from the bottom rim and the plumber who removed it believes the leakage was caused by old flux which plumbers used to use fitting these tanks. He believes the flux contained acid which slowly ate away at the copper rim. We are about to fit another one of your descalers in our refurbished second home.
